Have you ever heard of vitamin B17?
Maybe you have heard of its other name – Laetrile.

Americans cannot access vitamin B17 because the FDA took it off the market in the 1970s, and removed it from the B-Complex vitamins. It is unlawful for any health practitioner to administer this vitamin to patients. Apricot seeds are the best source for B17, but they have also been removed from the shelves of every health food store and natural market throughout the USA. Limited research has been conducted on vitamin B17 since 1977. Once it was banned, it was forgotten.

According to research from years ago, provided by nutritionists and medical scientists, vitamin B17 is a natural cyanide-containing compound that gives up its cyanide content only in the presence of a particular enzyme group called beta glucosidase or glucuronidase. Miraculously, this enzyme group is found almost exclusively in cancer cells. If found elsewhere in the body, it is accompanied by greater quantities of another enzyme, rhodanese, which has the ability to disable the cyanide and convert it into completely harmless substances. Cancer tissues do not have this protecting enzyme.

So, according to past scientific knowledge, cancer cells are faced with a double threat: the presence of one enzyme exposing them to cyanide, while the absence of another enzyme found in all other normal cells results in the cancer's failure to detoxify itself. Leave it to nature to provide a form of cyanide that can naturally destroy a cancer cell. The cancer cells that are unable to withstand the cyanide are destroyed, while the non-cancerous cells are not threatened by the cyanide, and, therefore, remain unharmed. Never underestimate the body's potential!

Vitamin B17 is found naturally in many foods. If you eat foods containing vitamin B17, your body will know what to do next. All other animals in nature instinctively do this. Consider it nature's cancer prevention. If only modern medicine would allow it.

San Francisco's Ernst T. Krebs, Sr., M.D. discovered the healing qualities of vitamin B17 in 1923. His sons, Ernst T. Krebs, Jr., Ph.D., and Byron Krebs, M.D. continued their father's research in 1952, refining Laetrile's (B17) nutritional qualities.

From their research, the Krebs believed cancer was not caused by an outside invading force but rather by malfunctions of the normal mechanics within the body itself. They identified cancer as a "deficiency disease". The body's malfunctions, according to their research, were the result of a deficiency of certain chemicals found in food, a deficiency of chemicals they specifically identified as vitamin B17, as well as a deficiency of enzymes known as trypsins produced in the pancreas.

The Krebs had discovered a natural, drugless method to help prevent cancer. But their discovery wasn't original. Years prior to any of the Drs. Krebs' works, Drs. George B. Wood and Franklin Bache, M.D. published a reference volume in 1833 in which they described amygdalin, derived from B17, as a common treatment for a wide range of diseases and disorders.

Vitamin B17 is also referred to as a nitriloside, which is the foundation for Laetrile, amygdalin, and prunasin. Together with the pancreatic enzyme trypsin, these can form a natural barrier against cancer growth. If foods containing any of the nitrilosides are eaten regularly, the body's own immune mechanisms can naturally battle cancer-forming cells. But if foods containing these critical vitamins are not regularly consumed (or manufactured), nature's mechanisms can't work as effectively against the buildup of factors at the root of cancer and the countless number of degenerative diseases.

This is happening to human beings today. Not only are advanced societies environmentally polluted to dangerous levels, but also more and more foods are being altered from their natural state by man's own doing. Modern freeze-dried, fat-free, sugar-free, calorie-free, weight-watchful, microwavable artificial food substitutes don't contain nitrilosides. Most food manufacturers don't even
Have you ever heard of vitamin B17?

**Know what nitrilosides are.** Never in human history have artificial foods saturated with preservatives and unhealthy chemicals dominated the food supply to the degree they do today. Modern nourishment is no longer nourishing.

In the late 1970's, Dr. Harold W. Manner, PhD., Chairman of the Biology Department at Loyola University, Chicago, Illinois, studied the overall value of Laetrile (B17). His work was well respected and considered among the first unbiased studies since the Krebs' in the 1920s. He reported Laetrile as being virtually non-toxic.

When Dr. Manner used Laetrile in his medical research, along with vitamin A and digestive enzymes, he discovered the production of antibodies was stimulated against spontaneous breast tumors in his laboratory mice. He studied the results of complete regression in 76 percent of the treated mice with mammary gland cancers.

Dr. Manner believed Laetrile received its best results when used in conjunction with digestive enzymes, a traditional balanced diet, and with vitamin A.

No physician has had more clinical experience with Laetrile than Ernesto Contreras, Sr., M.D. of the Contreras Hospital in Tijuana, Mexico, formerly The Oasis of Hope Hospital. Dr. Contreras has clinically used Laetrile for more than forty years on thousands of terminally diagnosed patients, and has received impressive results.

One of Dr. Contreras' patients was a man suffering from severe colon cancer. Using Laetrile treatments in conjunction with detoxification protocols and proper vitamin supplementation, Contreras was able to arrest the progression of his patient's cancer. The man lived more than fifteen years beyond his predicted death.

The following is a list of foods rich in vitamin B17:

- Watercress
- Spinach
- Bamboo sprouts
- Alfalfa sprouts
- Lentil sprouts
- Whole nuts
- Mung bean sprouts
- Ground nuts
- Garbanzo sprouts
- Apple seeds
- Apricot seeds

Contact AwesomeOrder.com for more information on B17 and B17 products.

[Editorial note: Alfalfa sprouts are not a healthy food and Spinach needs to be steamed (not eaten raw) as it contains goitrogens, which are harmful to the thyroid.]
